Product Overview

## The LPB

The LPB is a universal precast concrete light pole foundation that offers several distinct advantages over other precast pole foundations as well as cast-in-place concrete foundations.

## Adjustable Anchoring System

The Anchoring System, which is embedded into the top of the LPB, utilizes four $3 / 4$-inch or 1-inch diameter bolts and can accommodate bolt circle diameters as small as $7-1 / 2$-inches and as large as $13-1 / 2$-inches. This allows for the installation of a variety pole sizes and shapes, sure to fit most commercial light pole base plate configurations.

## Large Side Openings and Central Pathway

The LPB contains four large side openings that lead to a central vertical pathway sleeve. The size and location of the openings along with the pathway sleeve allow for flexibility and ease of electrical conduit installation from multiple directions.

Because the LPB has a standard size and configuration, designed to accommodate a variety of pole sizes and shapes, it can be produced in advance without knowing the specifics of the project. This reduces product lead times and allows for flexibility if project requirements change.

## Installation Efficiency

The LPB is cured and ready for installation when it arrives to the jobsite. Light poles can be installed within hours, rather than days, once the base has been set and backfilled. Less coordination between the installer and electrician is required and onsite construction effort has been minimized since the LPB does not require any formwork or tying of rebar in the field.

## Quality

Because the LPB is produced by trained personnel in a controlled environment, a high-quality product can be maintained. Mix designs are documented and quality assurance programs are followed, resulting in a predictable and consistent product.

Design
Approach

## Overview

The design of a LPB is completed by analyzing two distinct portions of the foundation. The first is the Anchoring System that is embedded into the top of the foundation and the second is the concrete foundation itself. The Anchoring System within the LPB consists of four slots, created by plastic inserts, each containing an anchoring nut that is located approximately $4-1 / 2$-inches below the top concrete surface. The procedures below outline the steps taken to complete the analysis of the Anchoring System and the concrete foundation.

## Anchoring System Analysis

## Step 1A

The first step in the analysis of the Anchoring System is to establish the dimensional parameters for the pole and the luminaires that will be attached to the top of the foundation. For the pole this includes the height, shape (round or square) and width or diameter. For the luminaires, this includes the Effective Projected Area (EPA), if known, or the contact/surface area and shape (flat or rounded sides) if the EPA is unknown.

## Step 2A

The second step in the process is to calculate the maximum wind pressures that will be acting on the pole and luminaires. The American Association of State Highway and Transportation Officials (AASHTO) publication: LRFD Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals, First Edition, 2015 (LRFDLTS-1) outlines the process for determining the maximum wind pressure acting on the pole and luminaires. The wind pressure is calculated using a basic wind speed, a wind exposure category and several other calculated coefficients/factors. Additional information regarding the calculation of wind pressure can be found in Chapter 3 of the AASHTO manual referenced above.

It is important to understand, that the Basic Wind Speed chosen as part of this step is based upon a Mean Recurrence Interval, Risk Category and location which must be established by the Designer. Determining the Basic Wind Speed is a critical step as it will greatly affect the amount of load transferred to the LPB Anchoring System. Additionally, the AASHTO LRFDLTS-1 considers wind to be an extreme event with a Load Factor of 1.0. Therefore, the wind pressures calculated as part of this step will not be increased further in subsequent steps.

## Step 3A

The third step consists of calculating the base reactions, or moment and shear at the base of the pole. This is competed by multiplying the effective area of the pole and the luminaires by the respective wind pressures that were determined in Step 2A. Additionally, since this is an LRFD design, the total moment and shear are multiplied by a Load Factor. As mentioned above, since wind is considered an Extreme Load, the Load Factor is 1.0 according to AASHTO Table 3.4-1.

## Step 4A

Once the base reactions have been determined the tension in the individual bolts can be calculated. At this point in the process, a bolt circle diameter will need to be chosen. The LPB allows for bolt circle diameters ranging from $7-1 / 2$-inches up to $13-1 / 2$-inches. Each bolt circle consists of four (4) $3 / 4$-inch or 1 -inch diameter carriage bolts with an anchoring nut that seats into the slot. The bolt circle diameter has a direct effect on the resulting bolt tension which is then transferred to the anchoring nut. Choosing a bolt circle diameter is a critical step and may be iterative as several diameters may need to be examined in order to satisfy the requirements of subsequent Steps. The bolt circle diameter is limited to no more or less than four (4) bolts and it is also important to keep in mind that the bolt circle diameter may be a set value based upon the proposed light pole that will be installed. In this case, refer to the light pole manufacturer for additional information.

The Total Tensile Load within a given bolt is based upon the following:

- Moment at the base of the pole
- The centroid distance to each bolt
- The moment of inertia of the bolt group
- And the stress area of the bolts

The example and Figure 1 below illustrate the calculation process for determining the tension in the bolts.

Centroid Distance to Bolts $=c=\frac{d}{2} \cdot \cos 45$
Tensile Stress Area of Each Bolt $=A_{T}=\frac{\pi}{4} \cdot\left[d_{b}-\frac{0.9743}{n}\right]^{2}$

$$
\begin{aligned}
& d_{b}=\text { bolt diameter }=0.75 \text { in } \\
& n=\text { threads per inch }=10 \\
& A_{T}=0.334 \mathrm{in}^{2}
\end{aligned}
$$

Moment of Inertia of Bolts $=I=\sum A_{T} \cdot c^{2}=4 \cdot A_{T} \cdot c^{2}$
Bolt Stress $=\frac{\text { Moment } \cdot c}{I}$
Bolt Tension $=T_{u}=\frac{\text { Bolt Stress }}{A_{T}}$

Figure 1

For additional information regarding the procedure outlined above, refer to the National Cooperative Highway Research Program document NCHRP Report 412.

## Step 5A

The next step in the analysis process is to check the adequacy of the Anchoring System. Given the proprietary use of the inserts and anchoring nuts, load testing of the Anchoring System was completed in order to determine the nominal tensile capacity. A full write-up of the testing completed is contained in Appendix A.

In total, 12 tests were completed at three different bolt circle diameters; 14 -inches, 10 -inches, and $7-1 / 2-$ inches. In each test, the anchor was loaded to 18,500 pounds which was a predetermined value based upon the actual anticipated loads. In all 12 tests, the Anchoring System held the applied load without failure. Based upon these results, LPB recommends using 18,500 pounds as the nominal tensile capacity of an individual anchor bolt within the Anchoring System.

According to the Chapter 5 Section 5.16.3 of the AASHTO LRFDLTS-1 manual, resistance factors for concrete anchorages shall be as specified in ACI 318-11, Appendix D. Section D.4.3 of ACI 318-11 specifies that for anchors governed by concrete breakout, side-face blow-out, pullout, or pryout (which is typically how the LPB Anchoring System performed) a reduction factor of 0.7 should be used for tension loads.

Step 5A within the analysis process compares the nominal tensile capacity, with reduction factor, to the applied load that was calculated in Step 4A. If the applied load exceeds the reduced nominal capacity, a different pole and bolt circle configuration will be required to reduce the applied load.

## Step 6A

According to the AASHTO LRFDLTS-1 manual and National Cooperative Highway Research Program (NCHRP) Report 469, anchor rods subject to more than 20,000 repeated applications of significant axial tension shall be checked for the fatigue limit state. This step begins the process of analyzing the system for fatigue loading. In Step 2A, the wind pressure that was calculated is considered the ultimate design load. In addition to analyzing for this load condition, fatigue must be considered using a lower wind pressure.

Step 6A consists of determining the resulting bolt stress based upon the pressure generated from Natural Wind Gusts. The Natural Wind Gust pressure is calculated using the Yearly Mean Wind Velocity, the drag coefficients for the pole and luminaires, and an Importance Factor, which is based upon a Fatigue Category. The equation for determining the Natural Wind Gust is based upon a Yearly Mean Wind Velocity of 11.2 miles per hour. If an alternate velocity is known, it may be used accordingly. For more information on the selection of the Fatigue Category, and resulting Importance Factor, refer to Section 11.6 of the AASHTO LRFDLTS-1.

For the purposes of this analysis process, truck-induced gusts and galloping have been ignored given the anticipated installation locations and pole/luminaires configurations to be used with the LPB. If either of these loading conditions are anticipated, given the actual site conditions, further analysis is recommended.

## Step 7A

The final step in the Anchoring System analysis process is to check the anchor rods with respect to the fatigue bolt stress that was calculated in Step 6A. The NCHRP Report 469 defines the stress range as the magnitude of the change in nominal stress due to the application or removal of the unfactored live load. The S-N curve for galvanized non-pretensioned anchor rods corresponds to detail Category $E^{\prime}$, however the fatigue threshold is much greater than other Category E' details. Therefore, in the case of anchor rods a threshold of

7000 psi is recommended per the NCHRP report. This is the value that is compared to the stress that was calculated in Step 6A. The NCHRP report states that no further evaluation of fatigue resistance is required if the stress in the anchor rod remains below the threshold stress range. However, LPB recommends that an additional check be completed. The additional check compares the combined fatigue tension and ultimate design tension to the reduced nominal capacity of the Anchoring System. This check is not prescribed in any Code or industry document but is merely a recommendation and may be used at the Designer's discretion.

It is worth noting that the NCHRP Report 469 states: "In steel-to-concrete joints subject to fatigue, the anchor rod will fail before the concrete fatigue strength is reached. Therefore, it is not necessary to consider the fatigue strength of the concrete." Based upon this statement, no additional fatigue analysis of the concrete Anchoring System has been completed.

Finally, it is possible to meet the requirements of Step 5A, based upon the chosen bolt circle diameter, but not meet the requirements of Step 7A. If this is the case, a larger bolt circle diameter will need to be used in Step 4A, if possible, and then the rest of the process re-analyzed.

## Foundation Analysis

## Step 1B

The first step in the foundation analysis is to establish the dimensional parameters for the foundation. This includes the total foundation length, the above grade length, shape, and diameter or width. The LPB has a minimum total length of 4 -feet and a maximum of 10 -feet. The foundation is generally produced in even 1-foot increments and the amount of above grade length may vary depending on analysis and project requirements Finally, the standard shape for the LPB is round with an above and below grade diameter of 24-inches. If foundation dimensions outside of the typical parameters stated are needed to meet the project requirements, contact LPB and/or the producer to discuss possible options.

It should be noted that determination of the total length and above grade length may become an iterative process based upon remaining analysis that is completed.

## Step 2B

The next step is to establish the parameters for the soils in which the foundation will be buried. The first parameter, which is critical to the analysis process, is to determine if the soils are cohesive or cohesionless. The primary difference between these soils types is in how the shear strength of the soil is determined. For cohesive soils, the shear strength is based upon cohesion or the attraction forces between the soil particles. For cohesionless soils, the shear strength depends on the internal friction angle of the soil particles. Cohesive soils are typically fine-grained soils such as clays and silts where as cohesionless soils are generally sands and gravels.

After the soil type has been defined, internal friction angle, soil unit weight, and cohesion will also need to be established. Most often these values will be obtained from a Geotechnical Report if one has been prepared for the project. If a report is not available, it is recommended that a geotechnical engineer be consulted to aid in the determination of the specific soil parameters.

## Step 3B

Once the foundation and soil parameters have been established, the ground line reactions can be calculated. The total unfactored moment and shear, at the base of the foundation, are determined using surface area of the foundation, pole and luminaire multiplied by a wind pressure that is specific to each component. The wind pressures are determined in the same manner as outlined in Step 2A of the Anchoring System Analysis and in accordance with AASHTO LRFDLTS-1.

Once the unfactored moment and shear at the base have been calculated, a factor of safety is applied to each value. It is at this point where LPB's analysis procedure varies from that which is outlined in AASHTO LRFDLTS-1. In the commentary portion of Section 13.6.1.1 (C13.6.1.1), equations are given to determine the required embedment based upon an analysis method developed by Broms (1964a and 1964b). The equations are based upon the ultimate load of the soils and utilize a factored moment and shear at the groundline. The commentary, however, does not clearly state the factor that should be applied to the shear and moment. Previous versions of the AASHTO manual, using an Allowable Stress Design (ASD), show the same procedure for calculating the required embedment depth but clearly state the factors that should be applied to the moment and shear. In AASHTO LTS-6, the commentary references a paper written by Broms where he suggests using an undercapacity factor of 0.7 and an overload factor of 2 to 3 . The value for the factor of safety is then determined by dividing the overload factor by the undercapacity factor. Based upon this information, it is LPB's recommendation, that this type of factor of safety should be used when utilizing Broms' approach. The inclusion of this factor can be seen in the analysis process and example calculation.

## Step 4B

At this point, the required foundation embedment is determined based upon the soil type and the factored shear and moment. The equations used in the calculation process are shown in the example and follow the method developed by Broms. It is possible that this step may become iterative as additional length is added to the overall foundation or the amount of above grade foundation is reduced to achieve the required embedment. If the required embedment cannot be achieved, based upon the dimensional parameters outlined in Step 1B, then an alternate pole and luminaire configuration may be required.

## Step 5B

This step determines the ultimate moment in the foundation shaft for the purposes of checking the reinforcing in the foundation. The equations used for calculating the maximum moment are based upon Broms' approach except that Broms' recommendation for the factor of safety has been removed. Instead, an AASHTO LRFD load factor has been applied. The reason for the difference is that the reinforcing check that is completed in the next step utilizes an LRFD approach and the maximum moment needs to be factored accordingly.

## Step 6B

The typical LPB is produced using minimum 5,000 psi concrete and is reinforced with four (4) \#6 vertical bars and \#3 stirrups spaced at approximately 12-inches on center. Step 6B checks to see if this typical reinforcing is adequate to resist the applied moment in the shaft of the foundation. The check is completed at two locations. The first location is the solid portion of the foundation and the second is at the knockout portion of the foundation where the universal pathway openings are located. In the first location, the entire cross section of concrete is used as well as all four vertical bars. At the second location, the section is treated as a 6 -inch wide by 24 -inch deep beam with a single \#6 bar. LPB has found that in general, the typical reinforcing (noted above) will be adequate and the previous steps in the analysis will generally control in the design.

## Design Example

The following Design Example has been prepared to show the analysis process that has been described above. It is important to understand that this example may not depict the Designer's actual site and project conditions. Understanding all of the input parameters and using them accordingly is critical to the analysis process. For additional information or to receive a copy of the analysis tool used to generate this example, please contact LPB.

## Anchoring System Analysis

## Pole Base Reactions

Are pole base reactions known? No (Proceed to Step 1A)

## Step 1A - Pole and Luminaire Input Parameters

## Step 2A - Determine Wind Pressures

| Total Tensile Load, $\mathrm{T}_{\mathrm{u}}=$ | 9359 | lb |

(Centroid distance to each bolt)
(Moment of inertia of bolt group)
(Bolt Stress $=M_{U} \cdot c / I$ )

Step 5A - Determine Bolt and Anchoring System Adequacy

(Based upon testing - See App. A)
(ACl 318 - App. D Section D.4.3)

| Applied Load <br> $\mathrm{T}_{\mathrm{u}}(\mathrm{lb})$ | Allowable Load <br> $\phi \mathrm{T}_{\mathrm{n}}(\mathrm{lb})$ | Result |
| :---: | :---: | :---: |
| 9359 | 12950 | OK |

## Anchoring System Analysis

## Step 6A - Fatigue Analysis - Natural Wind Gust Pressure, Pole Base Reactions and Bolt Stress

Note: Fatigue analysis is based upon input parameters from Steps 2A and 5A. If pole base reactions were manually entered, ensure that the information in Steps $2 A$ and 5A are correct before checking fatigue.

Wind Pressure due to Natural Wind Gusts $=P_{N W}=5.2 \cdot C_{d} \cdot\left(V_{\text {mean }} / 11.2\right)^{2} \cdot I_{F}$

| $\mathrm{V}_{\text {mean }}$ | $=1 \mathrm{mph}$ |
| ---: | :--- |
| $\mathrm{C}_{\mathrm{d} \text { Pole }}$ | $=1.2$ |
| $\mathrm{C}_{\mathrm{d} \text { Lum }}$ | 1.10 |
| Fatigue Category |  |
|  | Category III |
| $\mathrm{I}_{\mathrm{F}}$ | $=0.20$ |
|  |  |

| $\mathrm{P}_{\text {NW Pole }}=$ | 3.1 | $\mathrm{lb} / \mathrm{ft}^{2}$ |
| :--- | :--- | :--- |
| $\mathrm{P}_{\mathrm{NW} \text { Lum }}=$ | 3.4 | $\mathrm{lb} / \mathrm{ft}^{2}$ |

| Pole Area $=$ | 15.00 | $\mathrm{ft}^{2}$ |
| ---: | :---: | :---: |
| Luminaire Area $=$ | 4.00 | $\mathrm{ft}^{2}$ |

| Moment, $\mathrm{M}_{\mathrm{F}}$ | $=1 \mathrm{ft} \cdot \mathrm{lb}$ |
| ---: | :--- |
| Shear, $\mathrm{V}_{\mathrm{F}}$ | $=\square \mathrm{lb}$ |

Fatigue Bolt Stress, $\mathrm{S}_{\mathrm{F}}=22845 \mathrm{lb} / \mathrm{in}^{2}$
(AASHTO Section 11.7.1.2)
(Yearly mean wind velocity)
(AASHTO Section 3.8.7)
(AASHTO Section 3.8.7)
(AASHTO Section 11.6)
(AASHTO Table 11.6-1)
(From Step 3A)
(From Step 3A)
(Similar to calc in Step 5A above using $\mathrm{M}_{\mathrm{F}}$ - Bolt Stress $=\mathrm{M} \cdot \mathrm{c} / \mathrm{I}$ )

## Step 7A - Anchor Bolt Adequacy with Fatigue Loading

| Applied Maximum Stress Range <br> $\left(\mathrm{lb} / \mathrm{in}^{2}\right)$ | Threshold Stress Range <br> $\left(\mathrm{lb} / \mathrm{in}^{2}\right)$ | Result |
| :---: | :---: | :---: |
| 2845 | 7000 | OK |

| Combined Fatigue and Ultimate Tension <br> $\mathrm{T}_{\mathrm{F}}+\mathrm{T}_{\mathrm{u}}(\mathrm{lb})$ | Allowable Load <br> $\phi \mathrm{T}_{\mathrm{n}}(\mathrm{lb})$ | Result |  |
| :---: | :---: | :---: | :---: |
| Additional Check | $950+9359=10309$ | 12950 | OK |
|  |  |  |  |

(Note: The additional check shown above is not prescribed in any Code or industry document. It is ReCon's recommendation that the combined fatigue tension and ultimate design tension remain below the reduced nominal capacity of the anchoring system. This additional check is merely a recommendation and may be used at the Designer's discretion. )

## Notes Regarding Fatigue

According to Chapter 4 of the National Cooperative Highway Research Program (NCHRP) Report 469, anchor rods subject to more than 20,000 repeated applications of significant axial tension shall be checked for the fatigue limit state. The stress range is defined as the magnitude of the change in nominal stress due to the application or removal of the unfacotred live load (4.6). The S-N curve for galvanized nonpretensioned anchor rods corresponds to detail Category $\mathrm{E}^{\prime}$, however the fatigue threshold is much greater than other Category E' details. In the case of anchor rods a threshold of 7000 psi should be used ( 4.6 and C4.6). No further evaluation of fatigue resistance is required if the stress in the anchor rod remains below the threshold stress range (4.6). Finally, in steel-to-concrete joints subject to fatigue, the anchor rod will fail before the concrete fatigue strength is reached. Therefore, it is not necessary to consider the fatigue strength of the concrete (C-4.6).

## Step 1B - Input Foundation Dimensions

## Step 4B - Determine Required Foundation Embedment

Cohesionless Soils (C13.6.1.1-5)
$L^{3}-\frac{2 V_{F} L}{K_{p} \gamma D}-\frac{2 M_{F}}{K_{p} \gamma D}=0$

$$
K_{p}=\tan ^{2}\left(45+\frac{\phi}{2}\right) \quad \mathrm{K}_{\mathrm{p}}=3.00
$$

Cohesive Soils (C13.6.1.1-1)

$$
L=1.5 D+q\left(1+\sqrt{2+\frac{4 H+6 D}{q}}\right)
$$

$$
H=\frac{M_{F}}{V_{F}} \quad \mathrm{H}=19.5 \quad q=\frac{V_{F}}{9 c D} \quad \mathrm{q}=\mathrm{na}
$$

Req'd Embed in Cohesionless Soils, $\mathrm{L}=\square \mathrm{ft} \quad \square .0 \mathrm{OK}$

## Step 5B - Determine Ultimate Moment in Foundation Shaft for Reinforcing Check

| Max Applied Moment, $\mathrm{M}_{\max }=$ | 12845.0 | $\mathrm{ft} \cdot \mathrm{lb}$ | $\mathrm{H}=$ | 19.5 |
| ---: | :---: | :--- | ---: | :---: |
| Max Applied Shear, $\mathrm{V}_{\max }=$ | 660.2 | lb | $\mathrm{q}=$ | na |
|  |  |  | $\mathrm{K}_{\mathrm{p}}=$ | 3.00 |

Cohesionless Soils (C13.6.1.1-7)
$M_{u}=V_{\max }\left(H+0.54 \sqrt{\frac{V_{\max }}{\gamma D K_{p}}}\right)$
Location $=0.82 \sqrt{\frac{V_{\max }}{\gamma D K_{p}}}$
$\begin{aligned} & \text { Max Moment in Shaft, } \mathrm{M}_{\mathrm{u}}=13186.4 \\ & \mathrm{ft} \cdot \mathrm{lb} \\ & \text { Location Below Groundline }=0.79\end{aligned}$

Cohesive Soils (C13.6.1.1-4)

$$
M_{u}=V_{\max }(H+1.5 D+0.5 q)
$$

Location $=1.5 D+q$

Based upon the equations for Cohesionless soils

## Step 6B - Check Reinforcing in Foundation Shaft

| Concrete Strength, $\mathrm{f}^{\prime}{ }_{\mathrm{c}}=$ | 5000 |
| :---: | :---: |
| Reinforcing Yield Strength, $\mathrm{f}_{\mathrm{V}}=$ | 60000 |
| Concrete Unit Weight = | 145 |
| Reduction Factor, $\phi=$ | 0.9 |

Check Within the Soild Portion of the Foundation Shaft:

$$
\begin{array}{rll}
\text { Gross Area of Total Section, } \mathrm{A}_{\mathrm{g}}= & 452.4 & \mathrm{in}^{2} \\
\text { Dist between Bar Centers, } \mathrm{z}= & 16.5 & \text { in } \\
\text { Area Steel Provided, } \mathrm{A}_{\mathrm{sg}}= & 1.77 & \mathrm{in}^{2} \\
\rho_{\text {req }}=\left[1-\left(\sqrt{1-\frac{2 \cdot M_{u}}{\phi \cdot A_{g} \cdot z \cdot 0.85 f_{c}^{\prime}}}\right)\right] \cdot \frac{0.85 f_{c}^{\prime}}{f_{y}} \geq 0.0033 \\
\rho_{\text {req }}= & 0.00330 \\
\rho_{\text {prov }}=\mathrm{A}_{\mathrm{sg}} / \mathrm{A}_{\mathrm{g}}= & 0.00391 \quad \square
\end{array}
$$

## Foundation Analysis

## Step 6B - Check Reinforcing in Foundation Shaft (Continued)

Check Within the Knockout Portion of the Foundation Shaft - Treat as 24"Deep by 6" Wide Beam:

$$
\begin{aligned}
& \text { Beam Width, } \mathrm{b}= \\
& \text { Dist Outer Edge to Bar Center, } \mathrm{d}= 20.3 \\
&\text { Beam Area ( } \mathrm{b} \cdot \mathrm{~d}), \mathrm{A}_{\mathrm{b}}= 121.5 \\
& \text { in } \\
& \text { Area Steel Provided, } \mathrm{A}_{\mathrm{sb}}= 0.44 \\
& \mathrm{in}^{2} \\
& \mathrm{in}^{2}
\end{aligned} \quad \begin{aligned}
& \rho_{\text {req }}=\left[1-\left(\sqrt{1-\frac{2 \cdot M_{u}}{\phi \cdot b d^{2} \cdot 0.85 f_{c}^{\prime}}}\right)\right] \cdot \frac{0.85 f_{c}^{\prime}}{f_{y}} \geq 0.0033 \\
& \rho_{\text {req }}= \\
& \rho_{\text {prov }}=\mathrm{A}_{\mathrm{sb}} / \mathrm{A}_{\mathrm{b}}=\quad 0.00330
\end{aligned}
$$

# Design Tables 

## Overview and Notes

The LPB Design Tables have been prepared to demonstrate the capabilities of the foundation system with a variety of pole and fixture size scenarios. They have been prepared using a number of assumptions that can be found on each individual table. It is important to read and understand all of these assumptions. The tables have been prepared by ReCon Wall Systems, Inc. and to the best of ReCon's knowledge accurately represent the product use in the intended application. Anyone making use of these tables does so at their own risk and assumes all liability for such use. Final design, for construction purposes, must be completed by a Professional Engineer who is familiar with the project and has considered the specific site conditions.

The tables have been prepared in general accordance, as described in the Design Approach section of this manual, with the requirements found in the American Association of State Highway and Transportation Officials (AASHTO) publications: LRFD Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals, First Edition, 2015 (LRFDLTS-1)

Tables Included:

- 105 mph , Exposure C
- 4-inch, 6-inch, and 8-inch Round Poles, 4-inch and 6-inch Square Poles
- 120 mph , Exposure C
- 4-inch, 6-inch, and 8-inch Round Poles, 4-inch and 6-inch Square Poles
- 130 mph , Exposure C
- 4-inch, 6-inch, and 8-inch Round Poles, 4-inch and 6-inch Square Poles

## General:

- The LPB is produced with an embedded anchoring system that consists of four slots, created by plastic inserts, each set to receive an bolt and anchor plate located approximately $4-1 / 2$-inches below the top concrete surface. Each slot can accommodate one (1) $3 / 4$-inch or 1 -inch diameter bolt that projects from the top of the foundation. The bolt is secured in place using a single nut and a 3-inch by 3-inch bearing washer. The capacity of the anchoring system was determined through load testing completed by Braun Intertec. Refer to Appendix A for additional information regarding the testing completed.
- For the purposes of the Design Tables, the LPB is assumed to be round, 24-inches in diameter, with a total height of 8 -feet (maximum of 3 -feet exposed above grade). A 6 -foot foundation may be used in lieu of the 8 -foot foundation shown in the tables provided the minimum bury depth does not exceed 6-feet.
- For round-tapered and square-tapered light poles, the average diameter or width should be used to determine minimum bolt circle diameter and embedment depth within the tables.
- The tables assume a double light fixture with a total wind surface area equal to that shown. Single light fixtures, creating an unbalanced load condition, are not covered within the Design Tables.
- The weight of the fixtures, pole, and foundation are neglected as resisting forces in the calculation process.

## How to use the LPB Design Tables

## Choose Table Set

Choose a set of tables, based upon the design wind speed for the project location of the proposed LPB installation

Step 1
Choose the appropriate table, within the set, based upon the pole shape and diameter/width

## Step 2

Identify the appropriate row within the table based upon the anticipated pole height and total fixture area

Step 3
Is the proposed bolt circle diameter, for the pole chosen, greater than the minimum bolt circle diameter shown in the table?

Choose a new pole or fixture and repeat Steps 1 through 3

## Step 4

Determine the required embedment and the resulting exposed height based upon the soils in which the foundation will be buried. If the table contains an "NA" within the row that corresponds to the pole height and fixture area, it means that the foundation does not have adequate length to be installed given the conditions. In this case, a new configuration will need to be chosen and then Steps 1 through 4 repeated.

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

Step 1

| Step 1 |  |  |
| :---: | :--- | :---: |
| Pole Size: 4-inch Diameter | Pole Shape: Round |  |

| Step 2 |  |  | Step 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Step 3 | Cohesionless Soils $\phi=30^{\circ}$ and $\mathrm{c}=0 \mathrm{psf}$ |  | Cohesive Soils $\phi=12^{\circ}$ and $\mathrm{c}=\mathbf{2 5 0} \mathrm{psf}$ |  |
| Pole Height (ft) | Fixture Area ( $\mathrm{ft}^{2}$ ) | Minimum Bolt Circle Diameter <br> (in) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) |
| 15 | 1.0 | 7.5 | 5.0 | 3.0 | 5.8 | 2.2 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 6.1 | 1.9 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 6.5 | 1.5 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 7.0 | 1.0 |
| 20 | 1.0 | 7.5 | 5.0 | 3.0 | 6.4 | 1.6 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 6.7 | 1.3 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.2 | 0.8 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 7.6 | 0.4 |
| 25 | 1.0 | 7.5 | 5.0 | 3.0 | 7.0 | 1.0 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 7.4 | 0.6 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 8.0 | 0.0 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | NA |  |
| 30 | 1.0 | 7.5 | 5.0 | 3.0 | 7.6 | 0.4 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 8.0 | 0.0 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 6.0 | 9.0 | 5.1 | 2.9 | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table
- Weight of fixtures, pole, and foundation are neglected as resisting forces

## Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=105 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K z$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K d$ : per AASHTO Section 3.8.5. $K_{d}=0.95$ for round poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{v}=0.8$ for Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=1.10$ ( 4 -inch dia

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{v}=1.0$ for Non-Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=1.10$
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

## Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

| Step 1 |  |  |  |
| :---: | :--- | :---: | :---: |
| Pole Size: 6-inch Diameter | Pole Shape: Round |  |  |

| Step 2 |  | Step 3 | Step 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cohesionless Soils $\phi=30^{\circ}$ and $\mathrm{c}=0 \mathrm{psf}$ | Cohesive Soils $\phi=12^{\circ}$ and $\mathrm{c}=\mathbf{2 5 0} \mathrm{psf}$ |  |
| Pole Height (ft) | Fixture Area ( $\mathrm{ft}^{2}$ ) |  | Minimum Bolt Circle Diameter (in) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) |
| 15 | 1.0 | 7.5 | 5.0 | 3.0 | 6.1 | 1.9 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 6.3 | 1.7 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 6.8 | 1.2 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 7.2 | 0.8 |
| 20 | 1.0 | 7.5 | 5.0 | 3.0 | 6.8 | 1.2 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 7.0 | 1.0 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.5 | 0.5 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 8.0 | 0.0 |
| 25 | 1.0 | 7.5 | 5.0 | 3.0 | 7.5 | 0.5 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 7.8 | 0.2 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 6.0 | 8.0 | 5.0 | 3.0 | NA |  |
| 30 | 1.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 2.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 4.0 | 9.0 | 5.1 | 2.9 | NA |  |
|  | 6.0 | 10.5 | 5.4 | 2.6 | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table
- Weight of fixtures, pole, and foundation are neglected as resisting forces

Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=105 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.95$ for round poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{\mathrm{v}}=0.8$ for Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=0.75$ (6-inch dia.)

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{v}=1.0$ for Non-Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=1.10$
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

## Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

Step 1

| Step 1 |  |  |
| :---: | :--- | :---: |
| Pole Size: 8-inch Diameter | Pole Shape: Round |  |

| Step 2 |  |  | Step 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Step 3 | Cohesionless Soils $\phi=30^{\circ}$ and $\mathrm{c}=0 \mathrm{psf}$ |  | Cohesive Soils$\phi=12^{\circ} \text { and } \mathrm{c}=\mathbf{2 5 0} \mathrm{psf}$ |  |
| Pole Height (ft) | Fixture Area ( $\mathrm{ft}^{2}$ ) | Minimum Bolt Circle Diameter <br> (in) | Minimum Bury <br> Depth ( ft ) | Resulting Exposed Height (ft) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) |
| 15 | 1.0 | 7.5 | 5.0 | 3.0 | 6.0 | 2.0 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 6.3 | 1.7 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 6.7 | 1.3 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 7.1 | 0.9 |
| 20 | 1.0 | 7.5 | 5.0 | 3.0 | 6.7 | 1.3 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 6.9 | 1.1 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.4 | 0.6 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 7.8 | 0.2 |
| 25 | 1.0 | 7.5 | 5.0 | 3.0 | 7.3 | 0.7 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 7.6 | 0.4 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 6.0 | 7.5 | 5.0 | 3.0 | NA |  |
| 30 | 1.0 | 7.5 | 5.0 | 3.0 | 8.0 | 0.0 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 4.0 | 8.5 | 5.0 | 3.0 | NA |  |
|  | 6.0 | 10.5 | 5.3 | 2.7 | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table
- Weight of fixtures, pole, and foundation are neglected as resisting forces

## Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=105 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.95$ for round poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{\mathrm{v}}=0.8$ for Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=0.52$ ( 8 -inch dia.)

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{v}=1.0$ for Non-Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=1.10$
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

## Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Step 1
Pole Size: 4-inch Width
Pole Shape: Square

| Step 2 |  |  | Step 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Step 3 | Cohesionless Soils $\phi=30^{\circ}$ and $\mathrm{c}=0 \mathrm{psf}$ |  | Cohesive Soils $\phi=12^{\circ}$ and $\mathrm{c}=\mathbf{2 5 0} \mathrm{psf}$ |  |
| Pole Height (ft) | Fixture Area ( $\mathrm{ft}^{2}$ ) | Minimum Bolt Circle Diameter (in) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) |
| 15 | 1.0 | 7.5 | 5.0 | 3.0 | 6.2 | 1.8 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 6.4 | 1.6 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 6.8 | 1.2 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 7.2 | 0.8 |
| 20 | 1.0 | 7.5 | 5.0 | 3.0 | 7.0 | 1.0 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 7.2 | 0.8 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.6 | 0.4 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 8.0 | 0.0 |
| 25 | 1.0 | 7.5 | 5.0 | 3.0 | 7.7 | 0.3 |

|  | 2.0 | 8.0 | 5.0 | 3.0 | NA |  |
|  | 4.0 | 9.5 | 5.2 | 2.8 | NA |  |
|  | 6.0 | 11.5 | 5.5 | 2.5 | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table.
- Weight of fixtures, pole, and foundation are neglected as resisting forces

Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=105 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.90$ for square poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{v}=0.8$ for Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Square Light Poles, $C_{d}=1.81$ (4-inch wide)

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{\mathrm{v}}=1.0$ for Non-Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes)
Square Light Poles, $C_{d}=1.81$ (4-inch wide)
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

## Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

Step 1
Pole Size: 6-inch Width Pole Shape: Square

| Step 2 |  |  | Step 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Step 3 | Cohesionless Soils $\phi=30^{\circ}$ and $\mathrm{c}=0 \mathrm{psf}$ |  | Cohesive Soils $\phi=12^{\circ}$ and $\mathrm{c}=\mathbf{2 5 0} \mathrm{psf}$ |  |
| Pole Height (ft) | Fixture Area ( $\mathrm{ft}^{2}$ ) | Minimum Bolt Circle Diameter <br> (in) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) |
|  | 1.0 | 7.5 | 5.0 | 3.0 | 6.8 | 1.2 |
| 15 | 2.0 | 7.5 | 5.0 | 3.0 | 7.0 | 1.0 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.3 | 0.7 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 7.6 | 0.4 |
|  | 1.0 | 7.5 | 5.0 | 3.0 | 7.7 | 0.3 |
| 20 | 2.0 | 7.5 | 5.0 | 3.0 | 7.9 | 0.1 |
|  | 4.0 | 7.5 | 5.0 | 3.0 |  | A |
|  | 6.0 | 7.5 | 5.0 | 3.0 |  | NA |
| 25 | 1.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 2.0 | 8.0 | 5.0 | 3.0 | NA |  |
|  | 4.0 | 9.5 | 5.3 | 2.7 | NA |  |
|  | 6.0 | 10.5 | 5.5 | 2.5 | NA |  |
| 30 | 1.0 | 9.5 | 5.5 | 2.5 | NA |  |
|  | 2.0 | 11.0 | 5.6 | 2.4 | NA |  |
|  | 4.0 | 13.0 | 5.8 | 2.2 | NA |  |
|  | 6.0 | NA | NA |  | NA |  |

General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table.
- Weight of fixtures, pole, and foundation are neglected as resisting forces

Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=105 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.90$ for square poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{\mathrm{v}}=0.8$ for Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes)
Square Light Poles, $C_{d}=1.875$ ( 6 -inch wide)

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{\mathrm{v}}=1.0$ for Non-Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes)
Square Light Poles, $C_{d}=1.875$ ( 6 -inch wide)
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

Step 1

| Step 1 |  |  |
| :---: | :--- | :---: |
| Pole Size: 4-inch Diameter | Pole Shape: Round |  |

| Step 2 |  |  | Step 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Step 3 | Cohesionless Soils $\phi=30^{\circ}$ and $\mathrm{c}=0 \mathrm{psf}$ |  | Cohesive Soils $\phi=12^{\circ}$ and $\mathrm{c}=\mathbf{2 5 0} \mathrm{psf}$ |  |
| Pole Height (ft) | Fixture Area ( $\mathrm{ft}^{2}$ ) | Minimum Bolt Circle Diameter <br> (in) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) |
| 15 | 1.0 | 7.5 | 5.0 | 3.0 | 6.2 | 1.8 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 6.5 | 1.5 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.0 | 1.0 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 7.5 | 0.5 |
| 20 | 1.0 | 7.5 | 5.0 | 3.0 | 6.8 | 1.2 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 7.1 | 0.9 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.7 | 0.3 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | NA |  |
| 25 | 1.0 | 7.5 | 5.0 | 3.0 | 7.5 | 0.5 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 7.8 | 0.2 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 6.0 | 8.0 | 5.0 | 3.0 | NA |  |
| 30 | 1.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 2.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 4.0 | 8.5 | 5.2 | 2.8 | NA |  |
|  | 6.0 | 10.5 | 5.6 | 2.4 | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table
- Weight of fixtures, pole, and foundation are neglected as resisting forces

Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=120 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.95$ for round poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{\mathrm{v}}=0.8$ for Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=1.10$ ( 4 -inch dia

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{v}=1.0$ for Non-Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=1.10$
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

## Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

| Step 1 |  |  |  |
| :---: | :--- | :---: | :---: |
| Pole Size: 6-inch Diameter | Pole Shape: Round |  |  |

|  | 6.0 | 11.5 | 5.7 | 2.3 | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table.
- Weight of fixtures, pole, and foundation are neglected as resisting forces

Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=120 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.95$ for round poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{\mathrm{v}}=0.8$ for Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=0.75$ ( 6 -inch dia.)

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{v}=1.0$ for Non-Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=1.10$
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

## Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

Step 1

| Step 1 |  |  |
| :---: | :---: | :---: |
| Pole Size: 8-inch Diameter | Pole Shape: Round |  |

| Step 2 |  |  | Step 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Step 3 | Cohesionless Soils $\phi=30^{\circ}$ and $\mathrm{c}=0 \mathrm{psf}$ |  | Cohesive Soils$\phi=12^{\circ} \text { and } \mathrm{c}=\mathbf{2 5 0} \mathrm{psf}$ |  |
| Pole Height (ft) | Fixture Area ( $\mathrm{ft}^{2}$ ) | Minimum Bolt Circle Diameter <br> (in) | Minimum Bury <br> Depth ( ft ) | Resulting Exposed Height (ft) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) |
| 15 | 1.0 | 7.5 | 5.0 | 3.0 | 6.2 | 1.8 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 6.5 | 1.5 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.0 | 1.0 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 7.5 | 0.5 |
| 20 | 1.0 | 7.5 | 5.0 | 3.0 | 6.9 | 1.1 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 7.1 | 0.9 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.8 | 0.2 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | NA |  |
| 25 | 1.0 | 7.5 | 5.0 | 3.0 | 7.6 | 0.4 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 8.0 | 0.0 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 6.0 | 8.5 | 5.1 | 2.9 | NA |  |
| 30 | 1.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 2.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 4.0 | 9.5 | 5.3 | 2.7 | NA |  |
|  | 6.0 | 11.0 | 5.6 | 2.4 | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table.
- Weight of fixtures, pole, and foundation are neglected as resisting forces

Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=120 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.95$ for round poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{\mathrm{v}}=0.8$ for Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=0.52$ ( 8 -inch dia.)

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{v}=1.0$ for Non-Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=1.10$
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

Step 1
Pole Size: 4-inch Width Pole Shape: Square

| Step 2 |  |  | Step 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Step 3 | Cohesionless Soils $\phi=30^{\circ}$ and $\mathrm{c}=0 \mathrm{psf}$ |  | Cohesive Soils $\phi=12^{\circ}$ and $\mathrm{c}=\mathbf{2 5 0} \mathbf{~ p s f}$ |  |
| Pole Height (ft) | Fixture Area ( $\mathrm{ft}^{2}$ ) | Minimum Bolt Circle Diameter <br> (in) | Minimum Bury <br> Depth (ft) | Resulting Exposed Height (ft) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) |
| 15 | 1.0 | 7.5 | 5.0 | 3.0 | 6.6 | 1.4 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 6.9 | 1.1 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.3 | 0.7 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | 7.7 | 0.3 |
| 20 | 1.0 | 7.5 | 5.0 | 3.0 | 7.5 | 0.5 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 7.7 | 0.3 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 6.0 | 7.5 | 5.0 | 3.0 | NA |  |
| 25 | 1.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 2.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 4.0 | 8.0 | 5.0 | 3.0 | NA |  |
|  | 6.0 | 9.5 | 5.2 | 2.8 | NA |  |
| 30 | 1.0 | 8.5 | 5.0 | 3.0 | NA |  |
|  | 2.0 | 9.0 | 5.2 | 2.8 | NA |  |
|  | 4.0 | 11.0 | 5.5 | 2.5 | NA |  |
|  | 6.0 | 13.0 | 5.7 | 2.3 | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table.
- Weight of fixtures, pole, and foundation are neglected as resisting forces

## Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=120 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.90$ for square poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{\mathrm{v}}=0.8$ for Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Square Light Poles, $C_{d}=1.81$ (4-inch wide)

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{\mathrm{v}}=1.0$ for Non-Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes)
Square Light Poles, $C_{d}=1.81$ (4-inch wide)
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

## Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

Step 1
Pole Size: 6-inch Width Pole Shape: Square

| Step 2 |  |  | Step 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Step 3 | Cohesionless Soils $\phi=30^{\circ}$ and $\mathrm{c}=0 \mathrm{psf}$ |  | Cohesive Soils $\phi=12^{\circ}$ and $\mathrm{c}=\mathbf{2 5 0} \mathrm{psf}$ |  |
| Pole Height (ft) | Fixture Area ( $\mathrm{ft}^{2}$ ) | Minimum Bolt Circle Diameter (in) | Minimum Bury Depth ( ft ) | Resulting Exposed Height (ft) | Minimum Bury Depth (ft) | Resulting Exposed Height (ft) |
| 15 | 1.0 | 7.5 | 5.0 | 3.0 | 7.3 | 0.7 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | 7.5 | 0.5 |
|  | 4.0 | 7.5 | 5.0 | 3.0 | 7.9 | 0.1 |
|  | 6.0 | 7.5 | 5.0 | 3.0 | NA |  |
| 20 | 1.0 | 7.5 | 5.0 | 3.0 | 7.9 | 0.1 |
|  | 2.0 | 7.5 | 5.0 | 3.0 | NA |  |
|  | 4.0 | 7.5 | 5.1 | 2.9 | NA |  |
|  | 6.0 | 8.0 | 5.4 | 2.6 | NA |  |
|  | 1.0 | 8.5 | 5.4 | 2.6 | NA |  |
| 25 | 2.0 | 9.0 | 5.5 | 2.5 | NA |  |
|  | 4.0 | 10.5 | 5.7 | 2.3 | NA |  |
|  | 6.0 | 12.0 | 6.0 | 2.0 | NA |  |
| 30 | 1.0 | 12.0 | 6.1 | 1.9 | NA |  |
|  | 2.0 | 13.0 | 6.3 | 1.7 |  | NA |
|  | 4.0 | NA | NA |  | NA |  |
|  | 6.0 | NA | NA |  | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table.
- Weight of fixtures, pole, and foundation are neglected as resisting forces

Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=120 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.90$ for square poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{\mathrm{v}}=0.8$ for Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes) Square Light Poles, $C_{d}=1.875$ ( 6 -inch wide)

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{\mathrm{v}}=1.0$ for Non-Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes)
Square Light Poles, $C_{d}=1.875$ (6-inch wide)
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

## Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

Step 1

| Step 1 |  |  |
| :---: | :--- | :---: |
| Pole Size: 4-inch Diameter | Pole Shape: Round |  |

|  | 4.0 | 10.0 | 5.5 | 2.5 | NA |  |
|  | 6.0 | 12.5 | 5.9 | 2.1 | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table.
- Weight of fixtures, pole, and foundation are neglected as resisting forces

## Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=130 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.95$ for round poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{\mathrm{v}}=0.8$ for Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=1.10$ ( 4 -inch dia

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{\mathrm{v}}=1.0$ for Non-Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes) Round Light Poles, $C_{d}=1.10$
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Determining Minimum Bolt Circle Diameter and Embedment (8-foot LPB with 3-feet Exposed)

| Step 1 |  |  |  |

|  | 6.0 | NA | NA |  | NA |  |

## General Notes:

- A 6 -foot (total height) LPB may be used in lieu of the 8 -foot LPB provided that the minimum bury depth is less than 6 -feet. The resulting exposed height would then need to be adjusted accordingly.
- LPB size: round, $24^{\prime \prime}$ diameter
- For round-tapered and square-tapers poles, use average diameter or width
- Table assumes double light fixture with total fixture as shown. Single light fixtures creating an unbalanced load condition are not covered by this table
- Weight of fixtures, pole, and foundation are neglected as resisting forces

## Wind Loading Assumptions:

- Load Combinations and Load Factors: per AASHTO Section 3.4 and Table 3.4-1. For Extreme I the Load Factor for wind is 1.0 .
- The basic wind speed $V$ : per AASHTO Section 3.8.2. $V=130 \mathrm{mph}$; Risk Category: Low; Mean Recurrence Interval: 300 Years
- Wind Exposure Category: C
- Height and Exposure Factor $K_{z}$ : per AASHTO Section 3.8.4. For poles and fixtures this value is calculated for Exposure C and the actual height of the pole. For the pole foundation, $K_{z}=$ 0.86 .
- Directionality Factor $K_{d}$ : per AASHTO Section 3.8.5. $K_{d}=0.90$ for square poles.
- Gust Effect Factor $G$ : per AASHTO Section 3.8.6. $G=1.14$

Wind Loading Assumptions Cont.:

- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7 $C_{\mathrm{v}}=0.8$ for Extreme Limit Case Light Fixture, $C_{d}=1.2$ (flat side shapes) Square Light Poles, $C_{d}=1.875$ ( 6 -inch wide)

Fatigue Analysis Assumptions (for bolt circle diameter only):

- Yearly Mean Wind Velocity $V_{\text {mean }}$ : per AASHTO Section C11.7.1.2. $V_{\text {mean }}=11.2$ miles per hour
- Drag Coefficients $C_{d}$ : per AASHTO Section 3.8.7
$C_{\mathrm{v}}=1.0$ for Non-Extreme Limit Case
Light Fixture, $C_{d}=1.2$ (flat side shapes)
Square Light Poles, $C_{d}=1.875$ ( 6 -inch wide)
- Fatigue Importance Factor $I_{F}$ : per AASHTO Section 11.6 and Table 11.6-1. $I_{F}=0.55$ for noncantilevered traffic signals; Category III
- Fatigue loading check per AASHTO LRFDLTS-1 and NCHRP Report 496. Refer to the Design approach section of this report for additional information.

## Foundation Analysis Assumptions:

- Foundation analysis per AASHTO Section 13.6.1.1
- Minimum Bury in Cohesionless Soils per AASHTO Equation C13.6.1.1-5
- Minimum Bury in Cohesive Soils per AASHTO Equation C13.6.1.1-1
- Overload Factor $=2.0$ per AASHTO (LTS-6) Section C13.6.1.1
- Under Capacity Factor $=0.7$ per AASHTO (LTS-6) Section C13.6.1.1

Re: Universal Precast Light Pole Foundation Testing

This report is a summary of load testing performed on ReCon light pole foundations. The purpose of the testing was to verify the anchorage could withstand a test load of $18,250 \mathrm{lbf}$.

## Test Samples

Three $26^{\prime \prime}$ and one $24^{\prime \prime}$ diameter foundation samples were supplied for testing. The reinforcing layout and plastic insert is shown in figures 1 and 2 below.

## Concrete Strength Verification

Each of the samples was cast using a concrete mix with a specified minimum compressive strength of $5,000 \mathrm{psi}$. Concrete test cylinders were cast alongside the foundations and cured in the same environment. The cylinders were tested in accordance with ASTM C39, "Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens" the same day as the anchor tests on the foundations were performed. The test results are shown in table 1 below.

Table 1: Concrete Compressive Strength Results

| Cylinder <br> Specimen Age <br> (days) | Compressive Strength <br> (psi) | Average Compressive <br> Strength (psi) |
| :---: | :---: | :---: |
| 3 | 5,234 |  |
| 3 | 4,952 | 5,119 |
| 3 | 5,172 |  |

## Load Test Procedure

Two of the four anchor pockets in each foundation were load tested in tension. The samples were restrained by placing them in a load frame with steel tubes bearing on the top face. The load was applied to a single galvanized $3 / 4$ "-16 bolt and t-nut inserted into the channel using a calibrated hydraulic ram. The general test setup is shown in figure 3 below.

Figure 3: Test Setup

Load tests were performed with the threaded rod located either 4" or 7 " from the center of the foundation. These locations were selected to cover the full range of bolt circle diameters allowed by Recon Wall Systems, Inc. A test load of 18,250 Ibf was applied during each test and any visible cracks that appeared prior to that load were noted.

## Test Results.

The test results are shown in table 2 below.

Table 2: Load Test Results

| 14" Bolt Spacing |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Test Number | Foundation Number | Foundation Diameter (in) | Load Applied (Ibf) | Load at First Crack (lbf) | Test Result |
| 1 | 1 | 26 | 18,250 | 16,800 | Pass |
| 2 | 1 | 26 | 18,250 | 17,100 | Pass |
| 3 | 3 | 26 | 18,250 | NA | Pass |
| 4 | 3 | 26 | 18,250 | NA | Pass |
| 8" Bolt Spacing |  |  |  |  |  |
| Test Number | Foundation Number | Foundation Diameter (in) | Load Applied (lbf) | Load at First Crack (lbf) | Test Result |
| 1 | 3 | 26 | 18,250 | NA | Pass |
| 2 | 3 | 26 | 18,250 | NA | Pass |
| 3 | 2 | 24 | 18,250 | NA | Pass |
| 4 | 2 | 24 | 18,250 | NA | Pass |

The cracks occurring prior to reaching the test load appeared in a typical fashion. A vertical crack would start at the outside of the anchor and extend to the edge of the foundation and down the outside face to the approximate elevation of the first stirrup. The crack would then extend radially at around the circumference of the sample. An example of the cracks noted is shown in figure 4 below.

## General

In performing its services, Braun Intertec used that degree of care and skill ordinarily exercised under similar circumstances by reputable members of its profession currently practicing in the same locality. No warranty, express or implied, is made.

It has been a pleasure providing these testing services for you. If you have any questions regarding this report, please call Erik Knudson at 952.995.2384.

Sincerely,
BRAUN INTERTEC CORPORATION

Erik J. Knudson
Material Testing Technician
